

Grid User Function Library (CRUFLGrid)

Advanced Report Export Utility Export formatted data into a grid structure

Improved data flexibility

Some Crystal reports are designed to extract parts of your corporate data, perform sophisticated filtering, sorting, calculations and summaries and then to export the data as a CSV (or similar) list of values to use in another process in your system

But then when you export using the native Crystal Reports options you find a field format is not what you expect, or the line has a limit on how many values you can export.

Increase control

With the Grid UFL, you decide the size of a grid work area and then load each cell with the value and format you want. Then at the end of the report you save it as an external file using the field delimiters you want.

Support for Legacy reports

Crystal Reports has been around for a long time, and many older versions are still happily being used in legacy applications. The Grid UFL will install and work with any reports designed with Crystal Reports 5 and later.

Improved Performance

The Grid UFL is processed within the formulas as the report is viewed. No additional processing is needed. You just need to view the report and the export file(s)

Features

- ✓ Absolute control over grid size, format and content
- ✓ Works with a wide range of Crystal Reports versions
- ✓ Control over individual cell entries
- ✓ Export File is created while viewing the report
- ✓ Can create multiple files from one report
