

cViewSERVER

Reports scheduler

cViewSERVER schedules your Crystal Reports files to run automatically.

Save time

cViewSERVER schedules your reports to run at a convenient time so you do not have to be there or to wait for them to finish or be there to boot up the server. You select the output format in advance and where to send it.

Increase productivity

Once you set your options, your reports will be sent regularly to where you want. You can say what time and how frequently your reports will run, all without user intervention.

You decide on the output format from Crystal Reports and then say if they are to be printed, emailed as an attachment or saved to disk.

Extra flexibility

One report can be sent to multiple email addresses.

You have the option to send to remote or local printers or folders.

Emailing is independent of email client or email server. If your email server is unavailable, cViewSERVER will hold the output until the server is available.

Keep control

You manage the list of reports and the list of recipients.

You can set parameter input and a list of email addresses for each report.

You control the database passwords rather than giving the users a password.

Features

- ✓ Schedule hourly, daily, weekly and more.....
- ✓ Runs as a service
- ✓ Distribute automatically
- ✓ Parameters
